Have a Question?

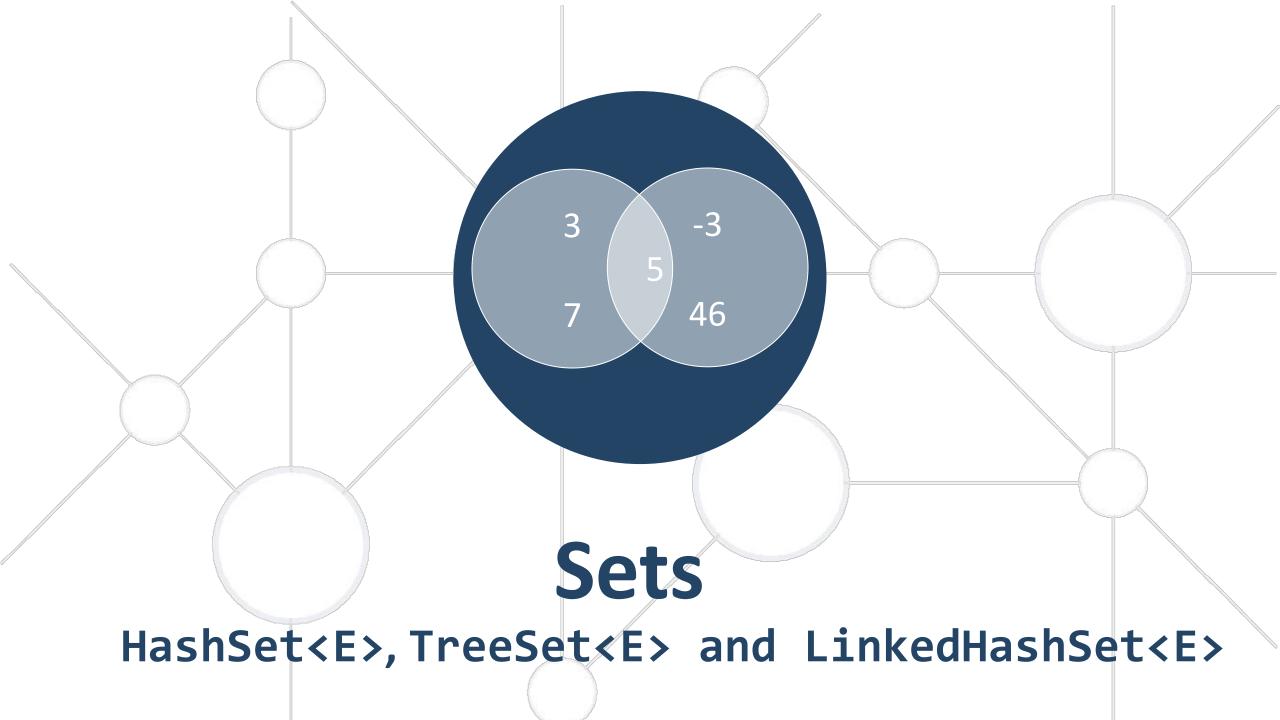

Table of Contents

1. Sets

- HashSet<E>
- TreeSet<E>
- LinkedHashSet<E>
- 2. Maps
 - HashMap<K, V>
 - TreeMap<K, V>
 - LinkedHashMap<K, V>

Sets in Java

- A set keeps unique elements
- Provides methods for adding/removing/searching elements
- Offers very fast performance
- Types:
 - HashSet<E>
 - Does not guarantee the constant order of elements over time
 - TreeSet<E>
 - The elements are ordered incrementally
 - LinkedHashSet<E>
 - The order of appearance is preserved

Methods

• Initialization:

```
Set<String> hash = new HashSet<String>();
```

For easy reading you can use diamond inference syntax:

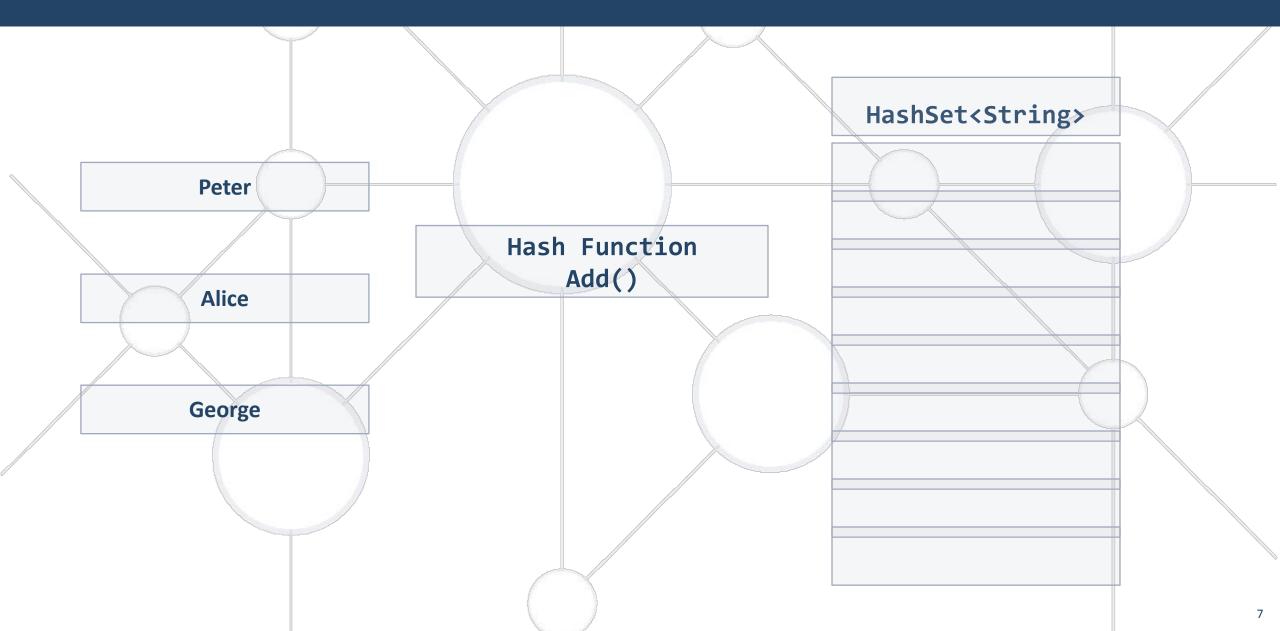

```
Set<String> tree = new TreeSet<>();
```

- .size()
- .isEmpty()

```
Set<String> hash = new HashSet<>();
System.out.println(hash.size());  // 0
System.out.println(hash.isEmpty());  // True
```

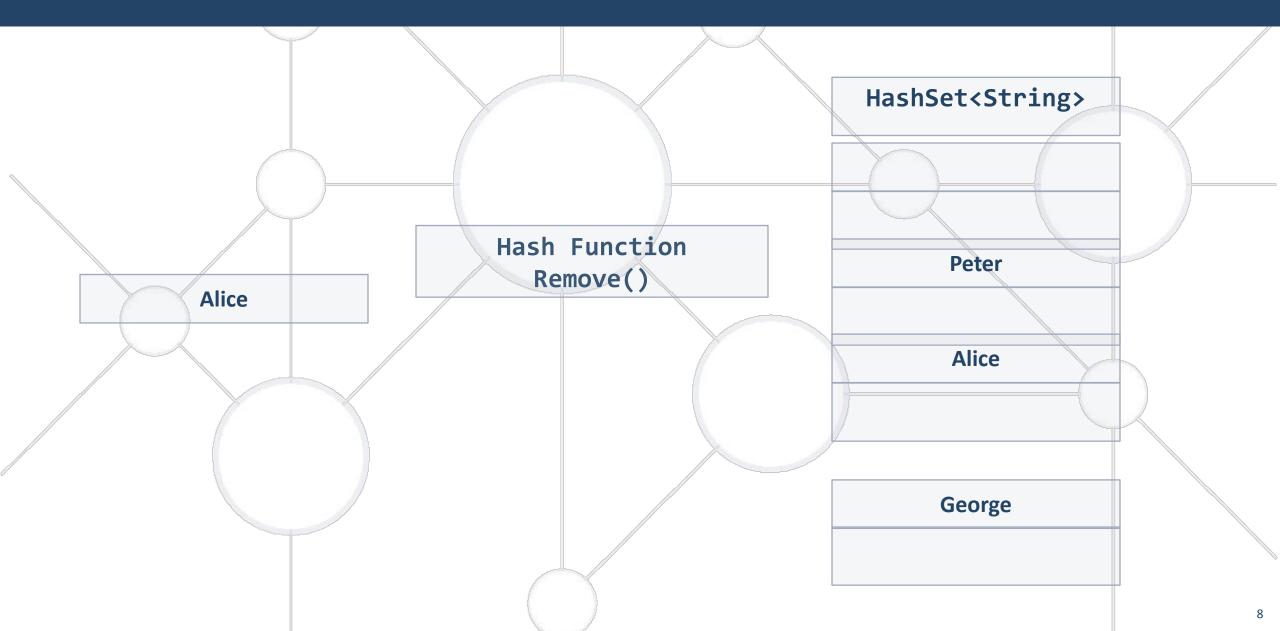

HashSet<E> - Add()

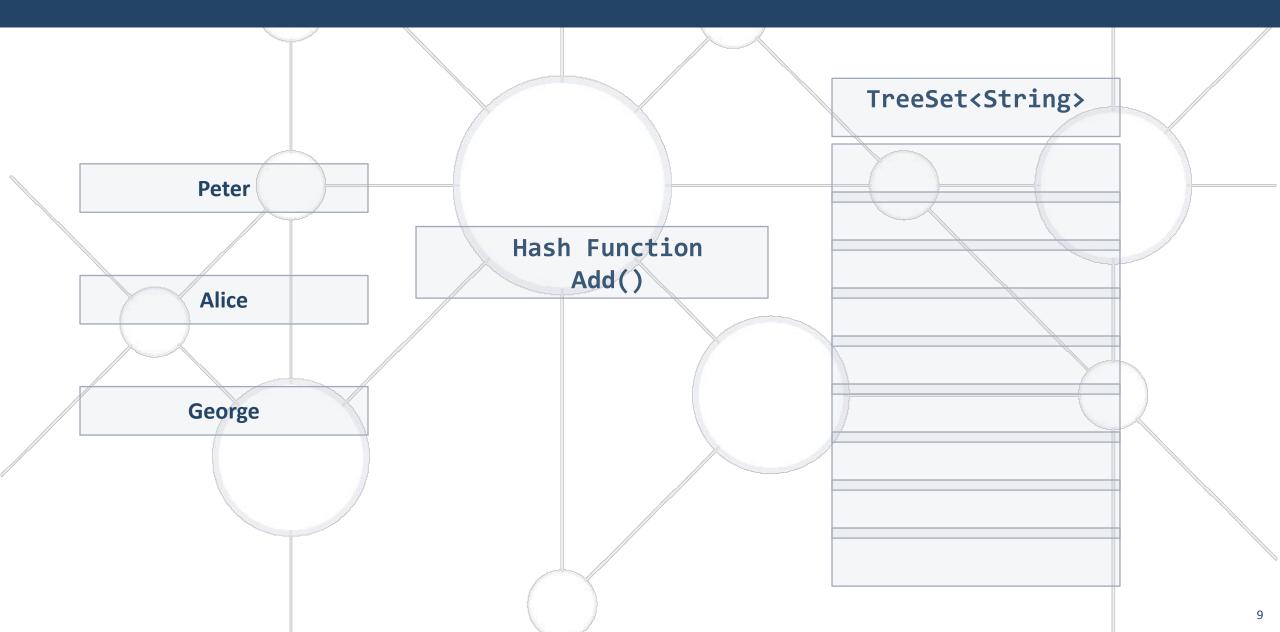

HashSet<E> - Remove()

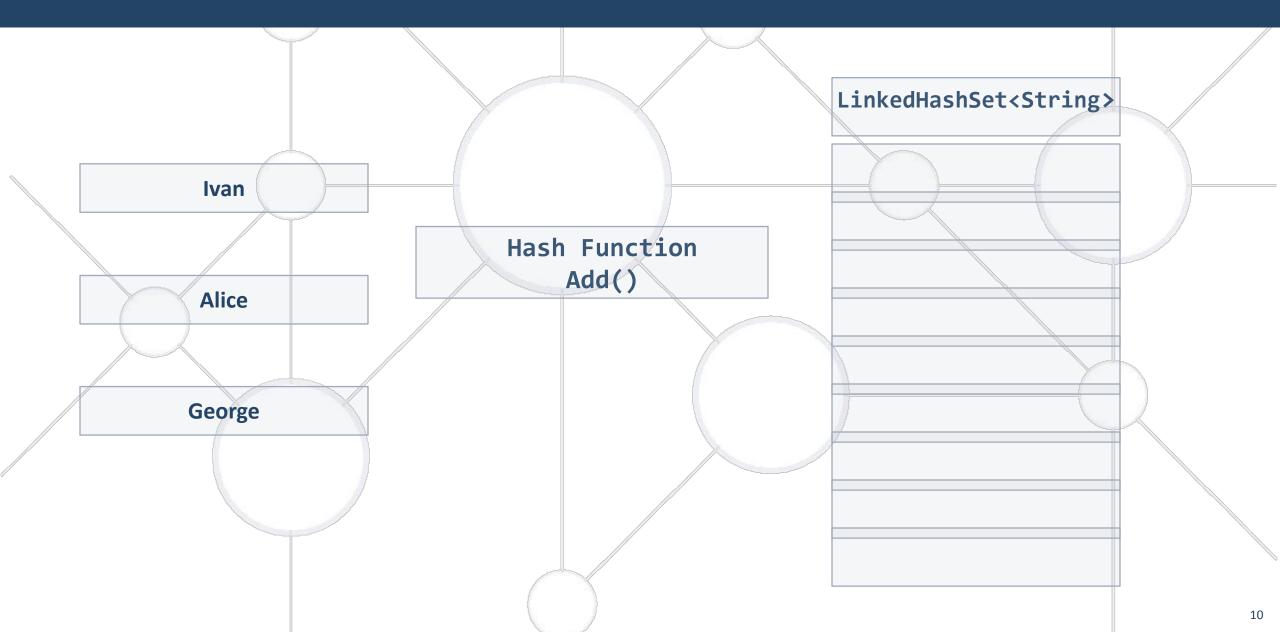

TreeSet<E> - Add()

LinkedHashSet<E> - Add()

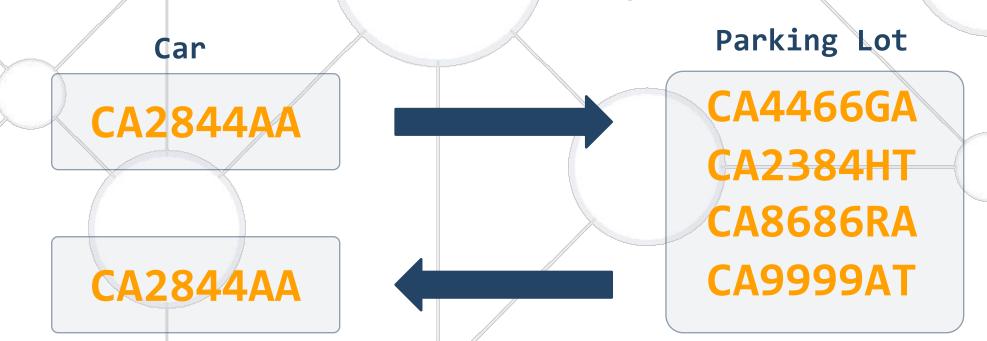

Problem: Parking Lot

- Write a program that:
 - Adds car number for every car that enters the parking lot
 - Removes car number when the car goes out

Check your solution here: https://judge.softuni.org/Contests/3957/Sets-And-Maps-Advanced-Lab-RS

Solution: Parking Lot

```
LinkedHashSet<String> parkingLot = new LinkedHashSet<>();
while(true)
  String input = sc.nextLine();
  if (input.equals("END"))
    break;
  else
    String[] reminder = input.split(", ");
    if (reminder[0].equals("IN"))
      parkingLot.add(reminder[1]);
                                               PARKING LOT
    else
      parkingLot.remove(reminder[1]);
```

Problem: SoftUni Party

- Guests are two types:
 - Regular
 - VIPs their tickets start with digit
- Until PARTY command, you will receive guest invitations
- Until END command, you will receive a second list with guests that actually came to the party
- Find how many guests didn't come to the party
- Print all guests that didn't come (VIPs first)

Reservation List

> 7IK9Yo0h 9NoBUajQ Ce8vwPmE SVQXQCbc

Solution: SoftUni Party

```
Set<String> vip = new TreeSet<>();
Set<String> regular = new TreeSet<>();
String guestId = scanner.nextLine();
while (!guestId.equals("PARTY")) {
  if (Character.isDigit(guestId.charAt(0)))
    vip.add(guestId);
                                  Return true
  else
                                    or false
    regular.add(guestId);
  guestId = scanner.nextLine();
//TODO: Remove the guests who came to the party
//TODO: Print results
```

Problem: "Voina" – Number Game

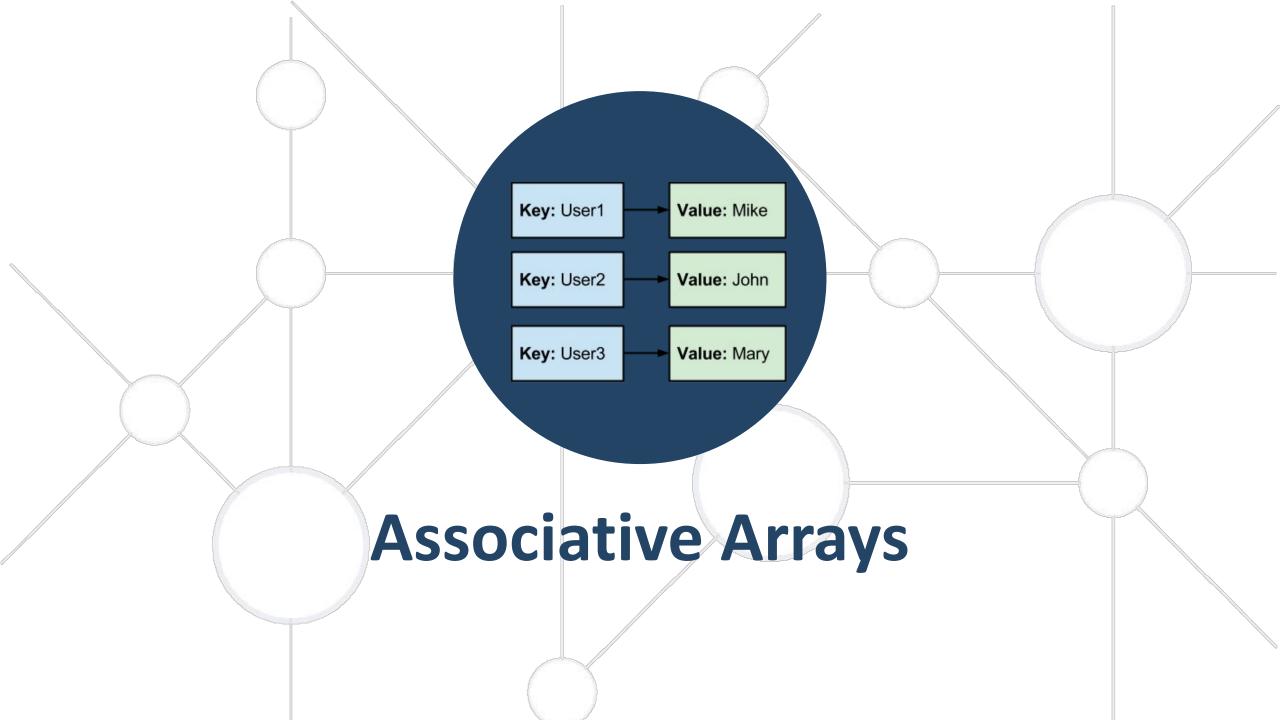

- Create a game that is played by two players:
 - Each one has 20 unique numbers (read from console, separated with space)
 - Every round each player bets his first number from the deck
 - Player with a bigger number wins and places both numbers at the bottom of his deck
 - A game ends after 50 rounds or when a player has 0 numbers

Solution: "Voina" – Number Game

```
LinkedHashSet<Integer> firstPlayer = getPlayerNumbers();
LinkedHashSet<Integer> secondPlayer = getPlayerNumbers();
for (int i = 0; i < 50; i++) {
  int firstNumber = firstPlayer.iterator().next();
  firstPlayer.remove(firstNumber);
 //TODO: get top number for second player
 if (firstNumber > secondNumber) {
     firstPlayer.add(firstNumber);
     firstPlayer.add(secondNumber);
  } else if (secondNumber > firstNumber)
    //TODO: finish logic about second player win or draw
//TODO: print result
```

Associative Arrays (Maps)

- Associative arrays are arrays indexed by keys
 - Not by the numbers 0, 1, 2, ...
- Hold a set of pairs <key, value>
- Traditional

key 0 1 2 3 4 value 8 -3 12 408 33

Associative array

key	value
John Smith	+1-555-8976
Lisa Smith	+1-555-1234
Sam Doe	+1-555-5030

Methods

Initialization

```
Map<String, Integer> hash = new HashMap<String, Integer>();
```

Type of keys

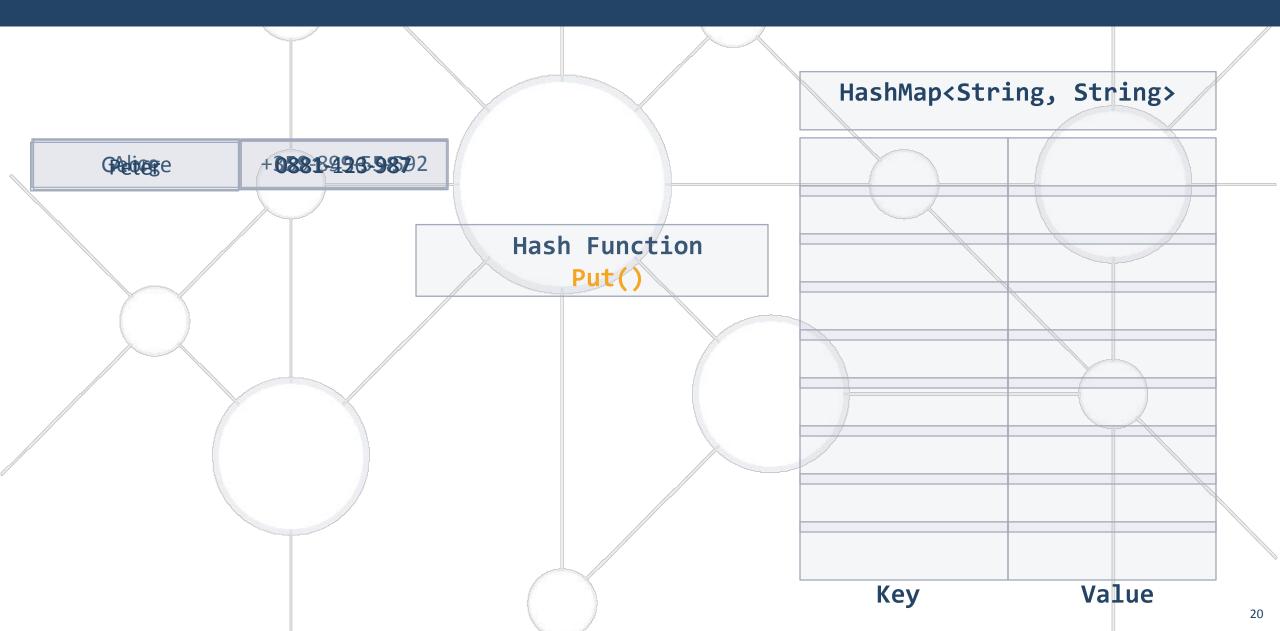

Type of values

- .size()
- .isEmpty()

```
Map<String, Integer> hash = new HashMap<>();
System.out.println(hash.size()); // 0
System.out.println(hash.isEmpty()); // True
```

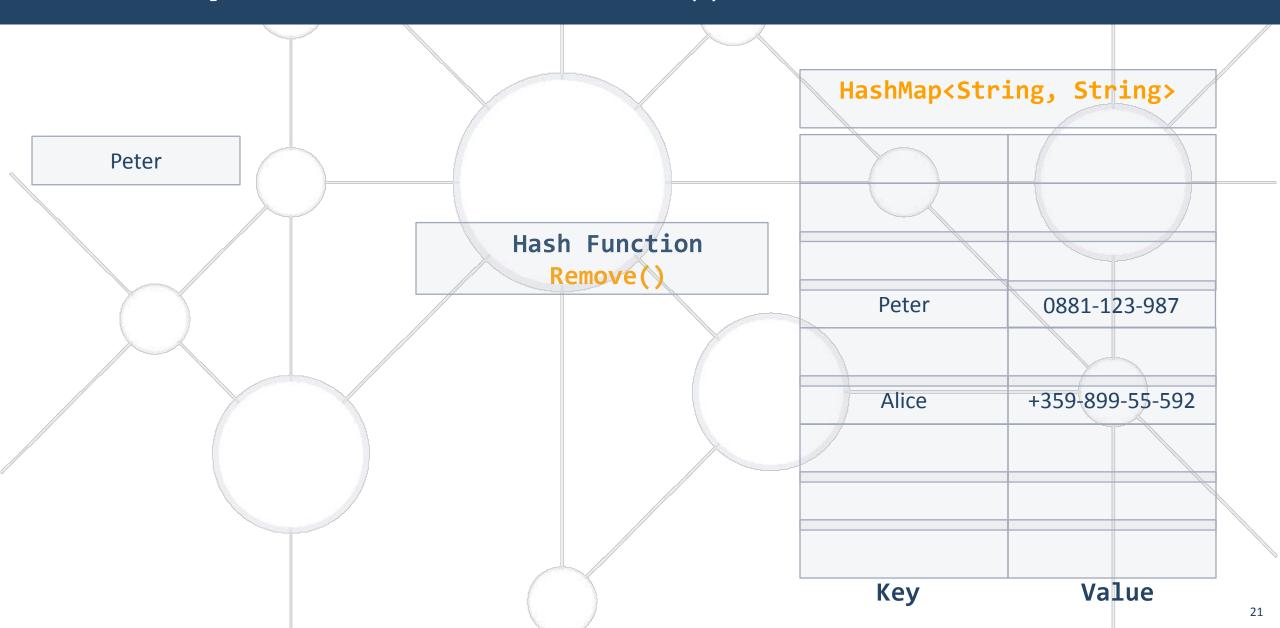

HashMap<K, V> - Put()

HashMap<K, V> - Remove()

Looping Through Maps – Example

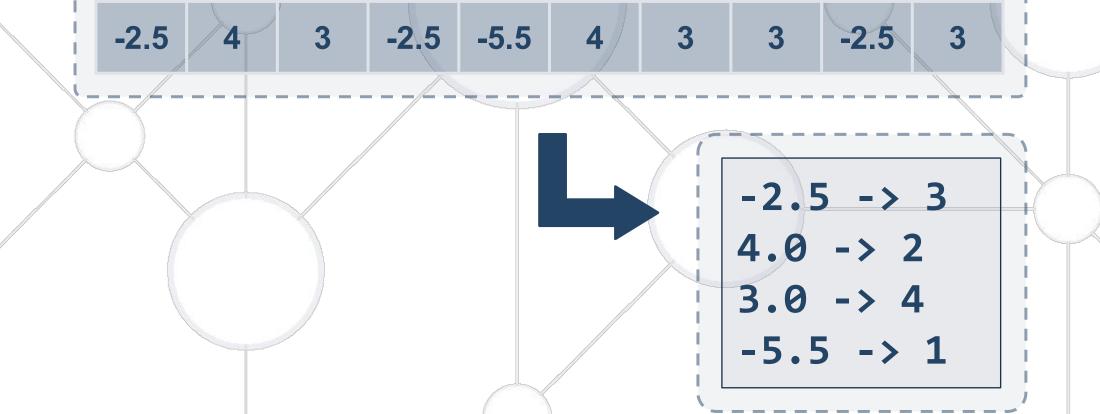

```
Map<String, Integer> vehicles = new HashMap<>();
vehicles.put("BMW", 5);
vehicles.put("Mercedes", 3);
vehicles.put("Audi", 4);
                             Override first value
vehicles.put("BMW", 10);
for(String key: vehicles.keySet())
                                      Return set of all keys
  System.out.println(key + " - " + vehicles.get(key));
                                                     Return value
                                                       for key
                        Audi
                        Mercedes
                        BMW
                             - 10
```

Problem: Count Real Numbers

 Write a program that counts in a given array of double values the number of occurrences of each value

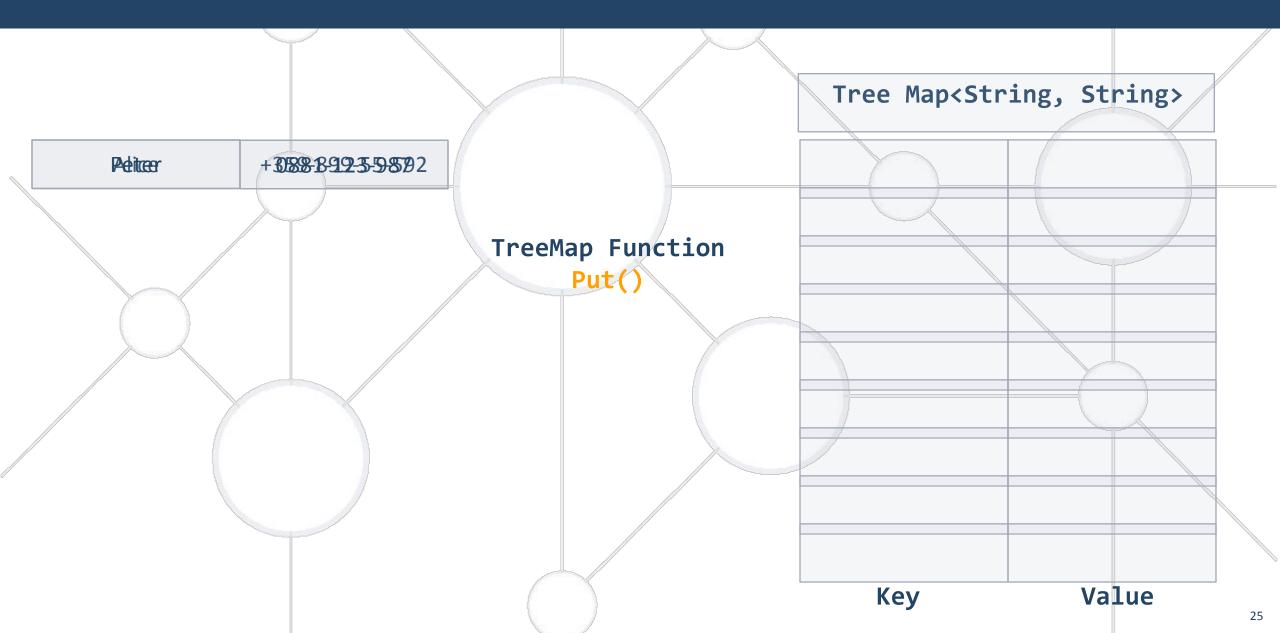

Solution: Count Real Numbers

```
LinkedHashMap<Double, Integer> result = new LinkedHashMap<>();
for (Double number : input) {
  if (!result.containsKey(number)) {
    result.put(number, 1);
  } else/{
    result.put(number, result.get(number) + 1);
for (Double key : result.keySet()) {
  System.out.println(key + " -> " + result.get(key));
```

TreeMap<K, V> - Put()

Problem: Academy Graduation

- Write a program that:
 - Reads a list of students and their score for some courses
 - Prints on the console sorted list with average score for each student

Student	Java Advanced	Java OOP
George	3.75	5
Maria	4.25	6
Peter	6	4.5

Student	Average
George	4,375
Maria	5,125
Peter	5,25

Solution: Academy Graduation

```
TreeMap <String,Double[]> graduationList = new TreeMap<>();
for (int i = 0; i < numberOfStudents; i++) {</pre>
  String name = scanner.nextLine();
  String[] scoresStrings = scanner.nextLine().split(" ");
  Double | scores = new Double | scores Strings.length |;
  for (int j = 0; j < scoresStrings.length; j++) {</pre>
    scores[j] = Double.parseDouble(scoresStrings[j]);
  graduationList.put(name, scores);
//TODO: print results
```

HashMap<K, V>, TreeMap<K, V>, LinkedHashMap<K, V>

- size() the number of key-value pairs
- keySet() a set of unique keys
- values() a collection of all values
- Basic operations put(), remove(), clear()
- Boolean methods:
 - containsKey() checks if a key is present in the Map
 - containsValue() checks if a value is present in the Map

Sorting Collections

Using sorted() to sort collections:

```
Ascending (Natural)
nums = nums.stream()
                                            Order
            .sorted((n1, n2) -> n1.compareTo(n2))
           .collect(Collectors.toList());
                                      Descending
nums = nums.stream()
                                         Order
           .sorted((n1, n2) -> n2.compareTo(n1))
```

.collect(Collectors.toList());

Sorting Collections by Multiple Criteria

Using sorted() to sort collections by multiple criteria:

```
Map<Integer, String> products = new HashMap<>();
products.entrySet()
     .stream()
     .sorted((e1, e2) -> {
        int res = e2.getValue().compareTo(e1.getValue());
                         Second criteria
        if (res == 0)
          res = e1.getKey().compareTo(e2.getKey());
        return res; }) Terminates the stream
     .forEach(e -> System.out.println(e.getKey() + " " + e.getValue()));
```

Using Functional ForEach (1)

```
Map<String, ArrayList<Integer>> arr = new HashMap<>();
arr.entrySet().stream()
   .sorted((a, b) -> {
     if (a.getKey().compareTo(b.getKey()) == 0) {
       int sumFirst = a.getValue().stream().mapToInt(x -> x).sum();
       int sumSecond = b.getValue().stream().mapToInt(x -> x).sum();
       return sumFirst - sumSecond;
                                       Second
                                        criteria
     return b.getKey().compareTo(a.getKey()); 
                                                 Descending
                                                   sorting
```

Using Functional ForEach (2)

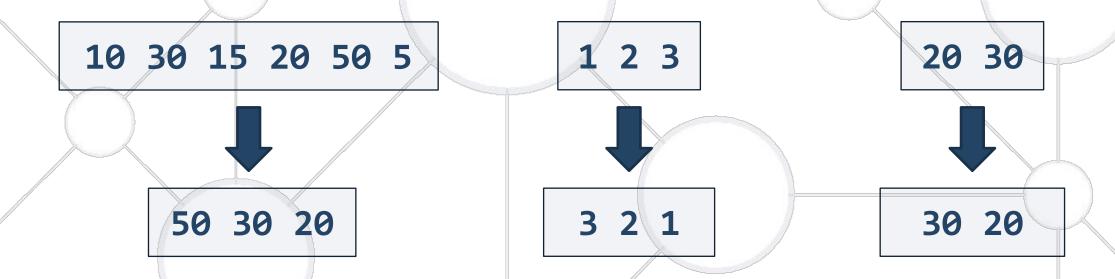

```
.forEach(pair -> {
 System.out.println("Key: " + pair.getKey());
  System.out.print("Value: ");
  pair.getValue().sort((a, b) -> a.compareTo(b));
  for (int num : pair.getValue()) {
    System.out.printf("%d ", num);
  System.out.println();
});
```

Problem: Largest 3 Numbers

- Read a list of numbers
- Print the largest 3, if there are less than 3, print all of them

Check your solution here: https://judge.softuni.org/Contests/3957/Sets-And-Maps-Advanced-Lab-RS

Solution: Largest 3 Numbers

```
List<Integer> nums = Arrays
                .stream(sc.nextLine().split(" "))
                .map(e -> Integer.parseInt(e))
                .sorted((n1, n2) -> n2.compareTo(n1))
                 /limit(3)
                .collect(Collectors.toList());
for (int num : nums) {
            System.out.print(num + " ");
```

Check your solution here: https://judge.softuni.org/Contests/3957/Sets-And-Maps-Advanced-Lab-RS

Summary

- HashSet<E>, TreeSet<E> and LinkedHashSet<E> hold unique elements and are very fast
- HashMap<K, V>, TreeMap<K, V> and LinkedHashMap<K, V> are associative arrays where a value is accessed by its key
